DETECTION OF THE SECULAR DEFORMATION ASSOCIATED WITH THE SUBDUCTION OF THE PHILIPPINE SEA PLATE WITH ALOS/PALSAR

Acknowledgments

- PALSAR level 1.0 data are shared among *PIXEL* (coordinator: Dr. Taku Ozawa), Earthquake WG (Geographical Survey Inst.) and provided from JAXA under cooperative research contract with ERI, Univ. Tokyo.
- The ownership of PALSAR data belongs to METI (Ministry of Economy, Trade and Industry) and JAXA.

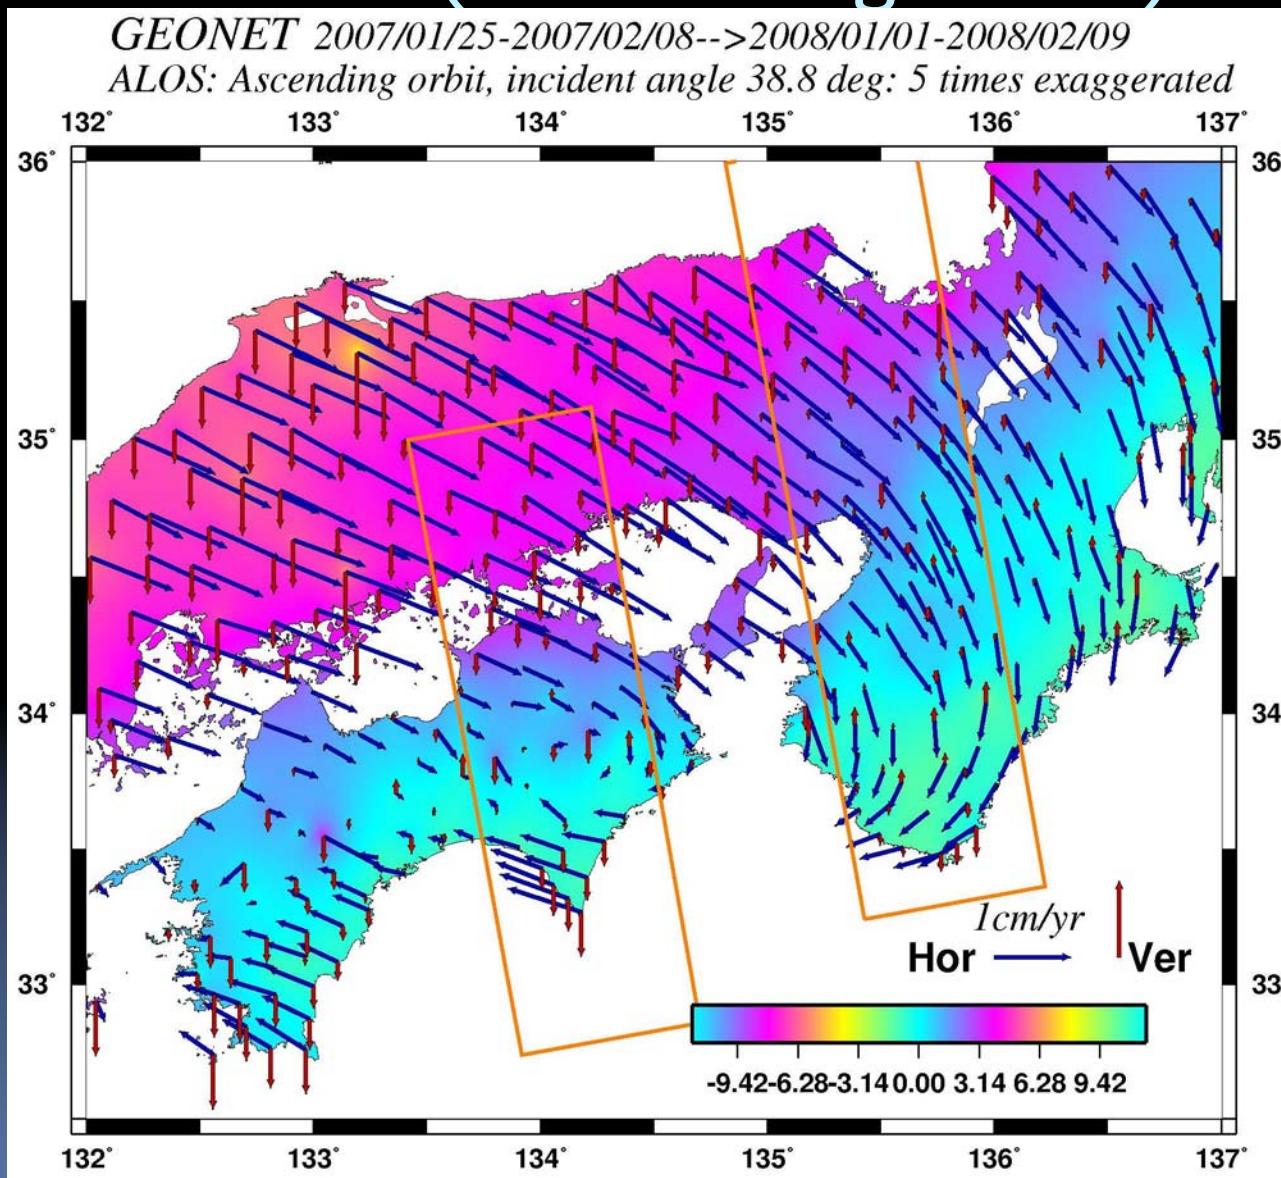

Motivation

- Examples of InSAR time series analyses
 - Ground subsidence
 - Creep along active faults
 - Volcanic deformation
- Frontier
 - Secular deformation in subduction zones
 - One example with ERS←low spatial density
 - Long wave-length \sim orbital error
 - Small deformation

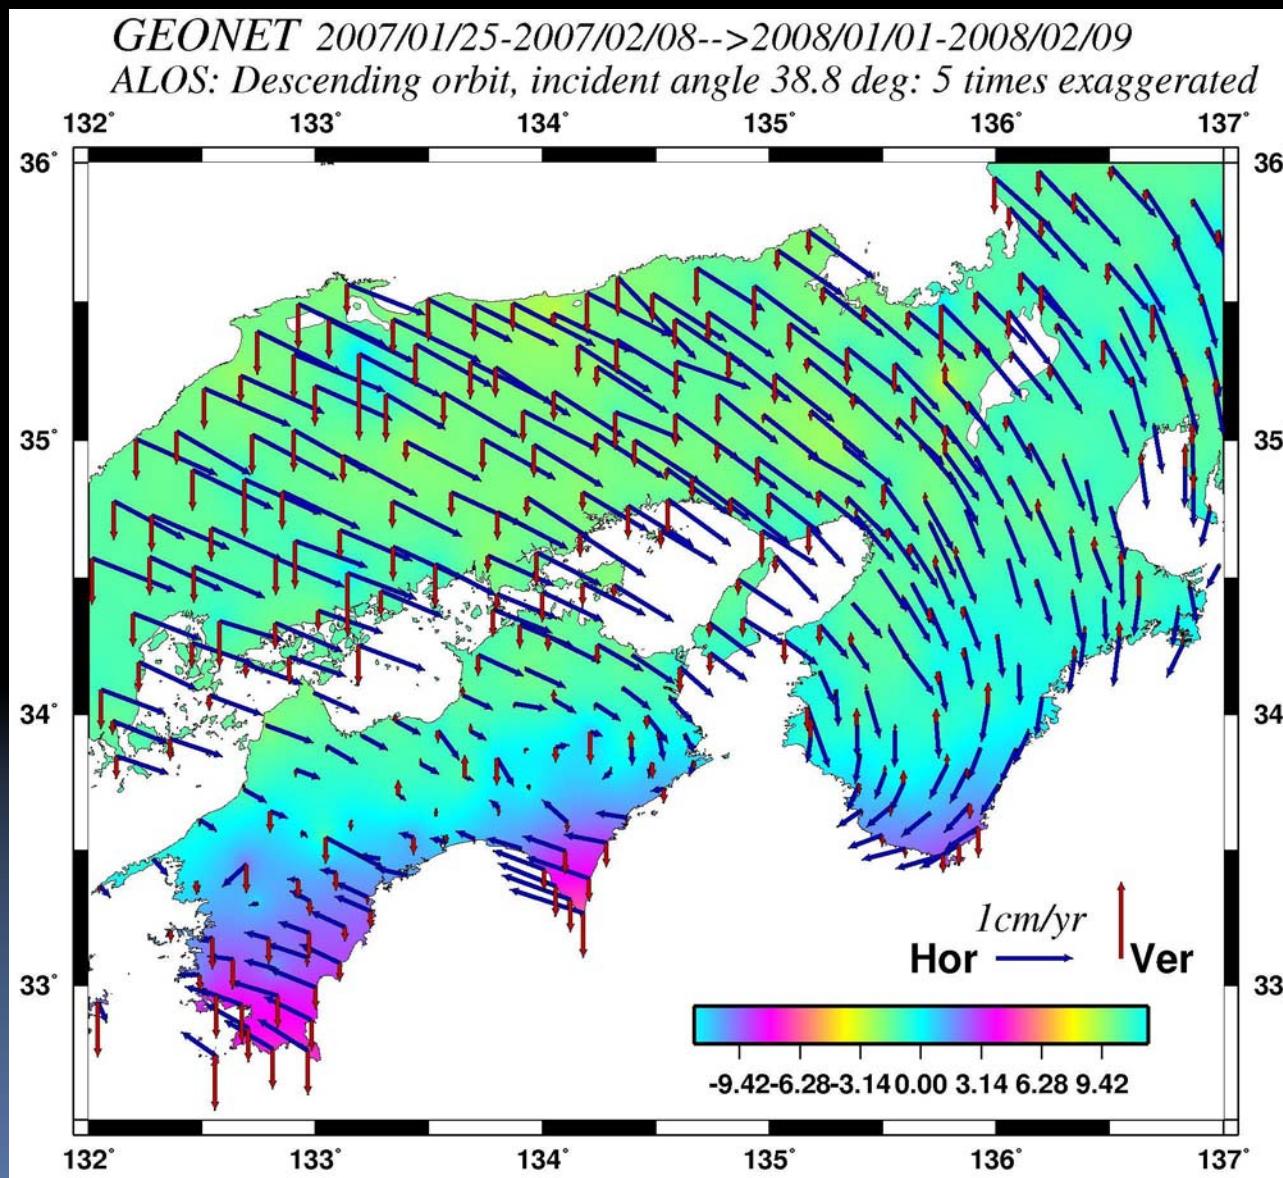

InSAR Analyses of ALOS/PALSAR Data in Kii Peninsula and Shikoku

- Large deformation due to the subduction of the PHL plate
- Strike of island arc perpendicular to path of ALOS
 - Gradient of deformation is parallel to the path
- InSAR and stacking of data from May, 2006 to July, 2008

Synthetic Interferogram from GEONET Velocities (Ascending Path)

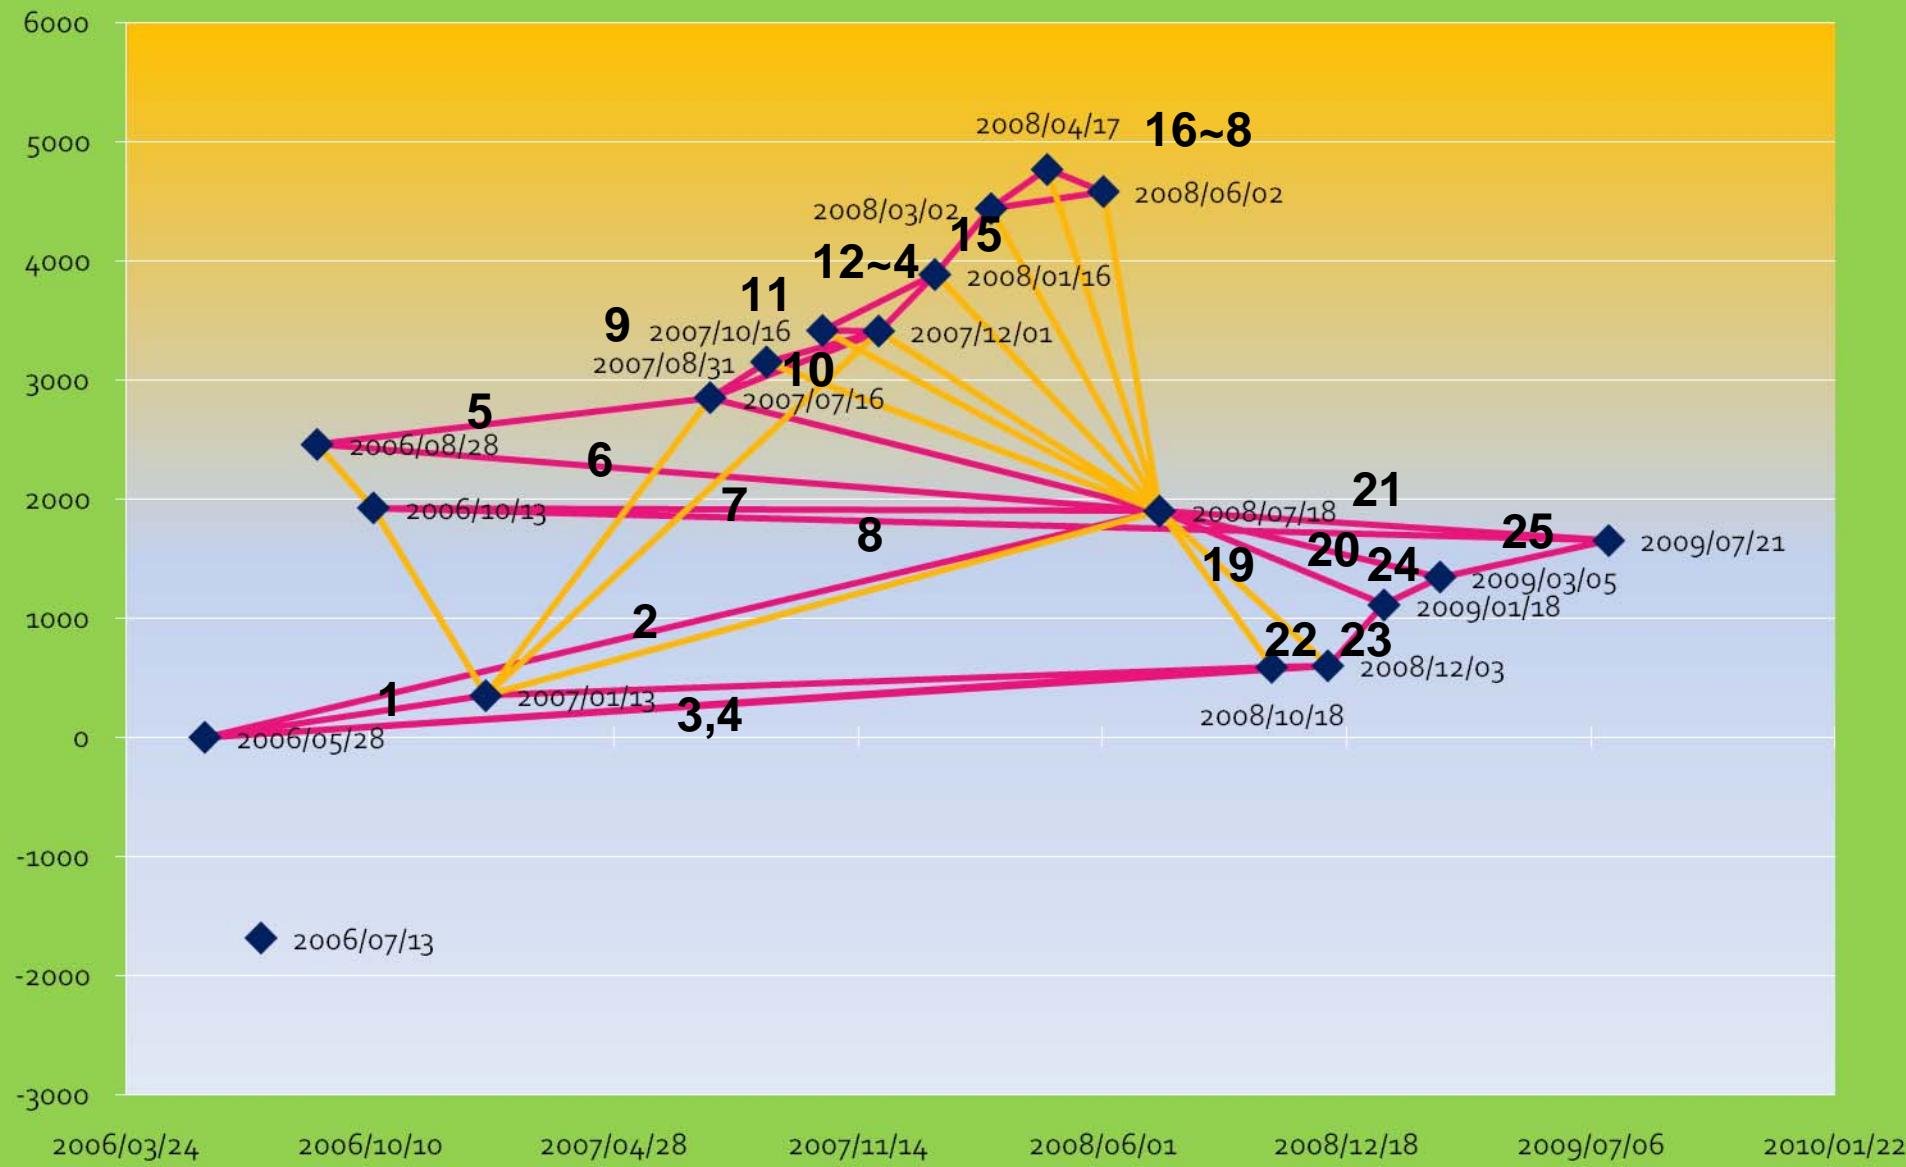

Synthetic Interferogram from GEONET Velocities (Descending Path)

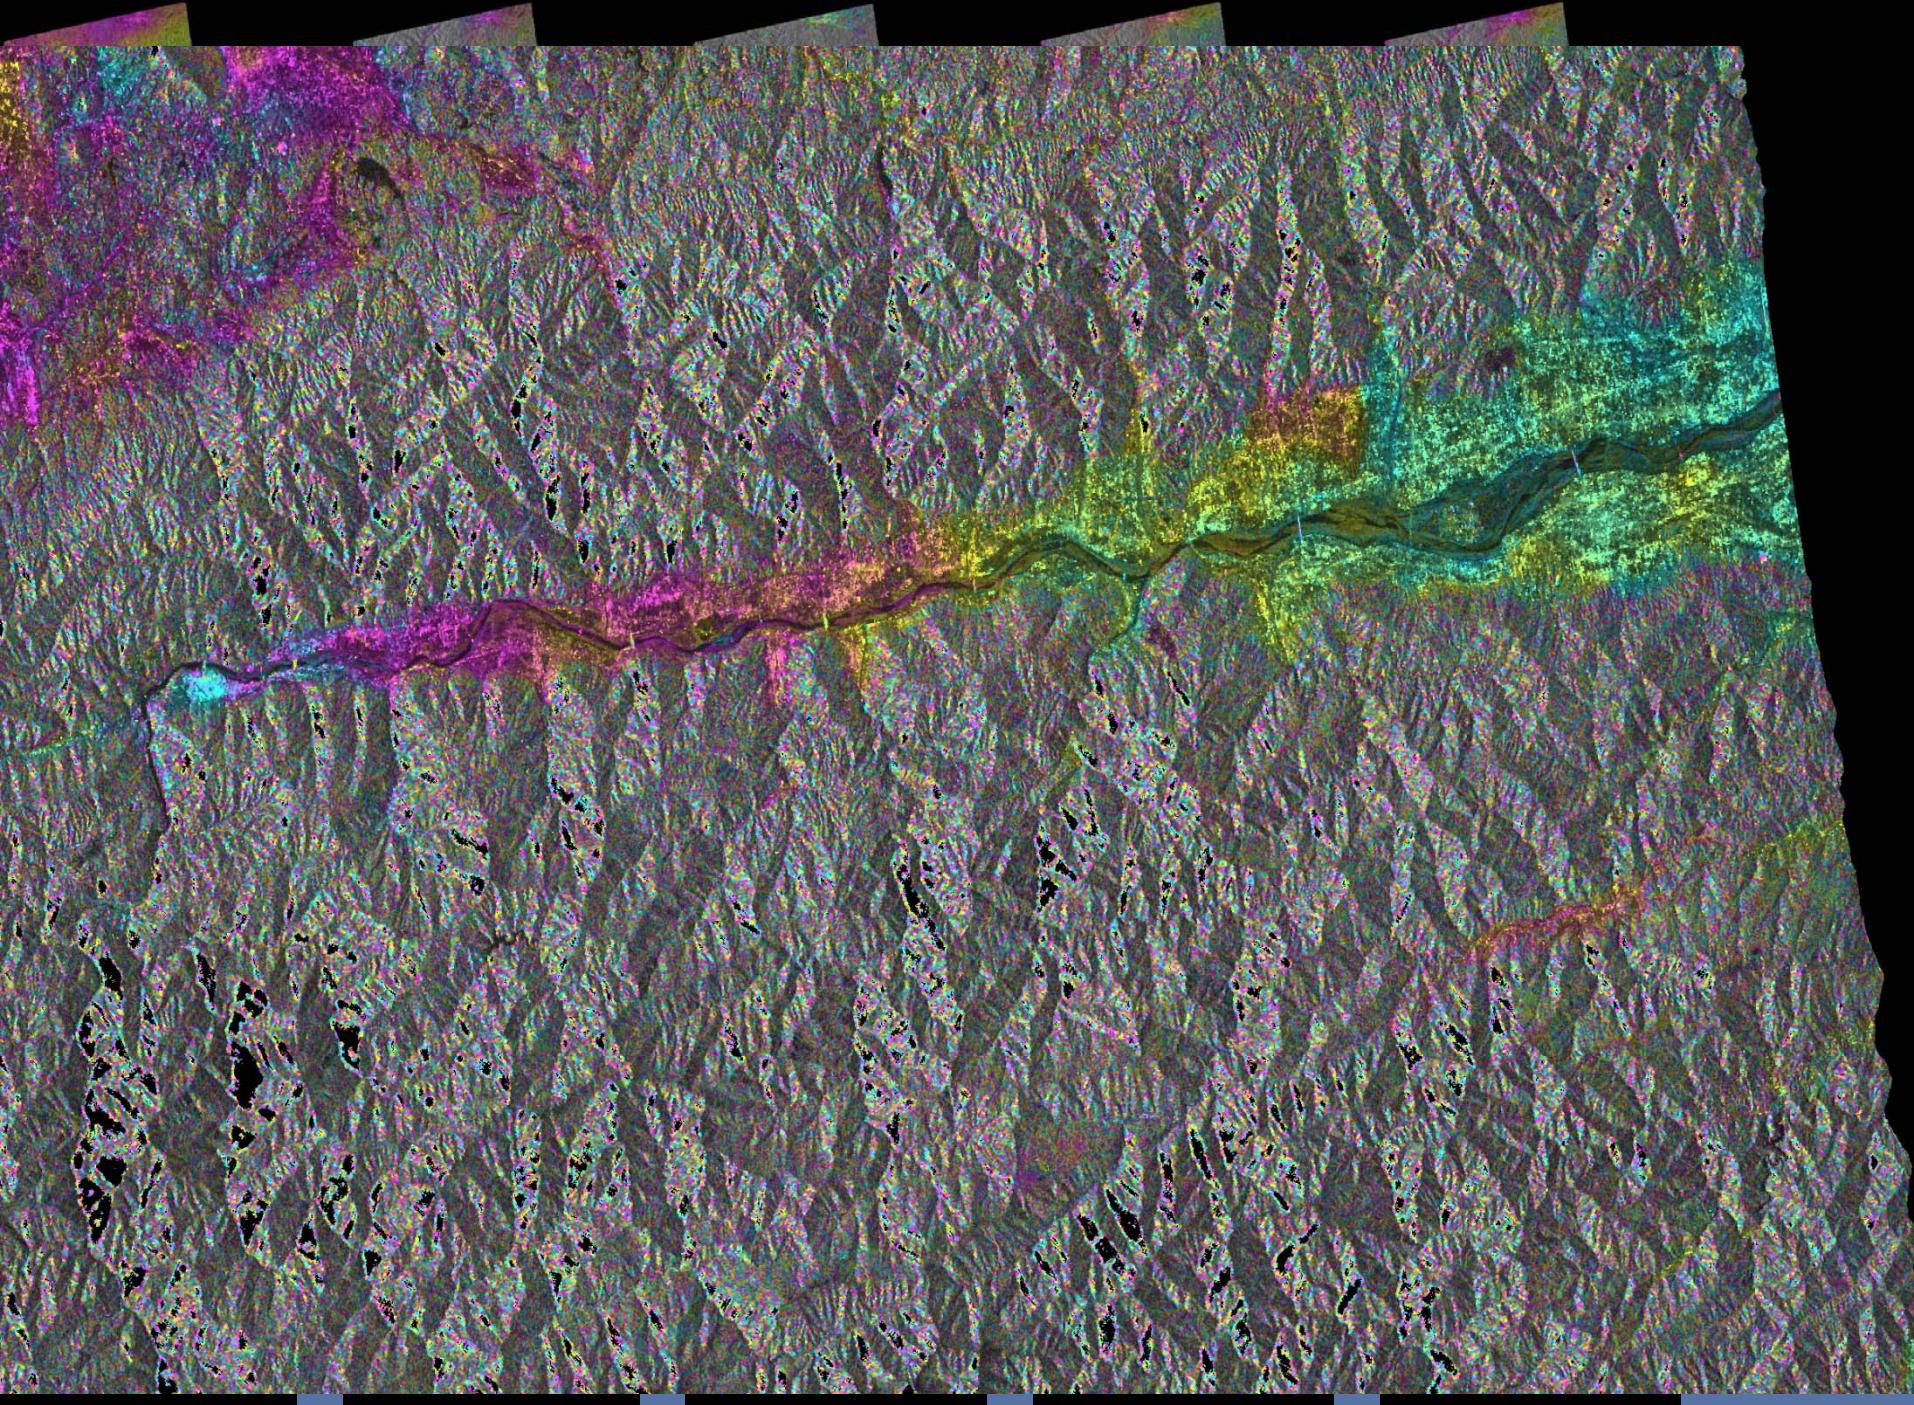

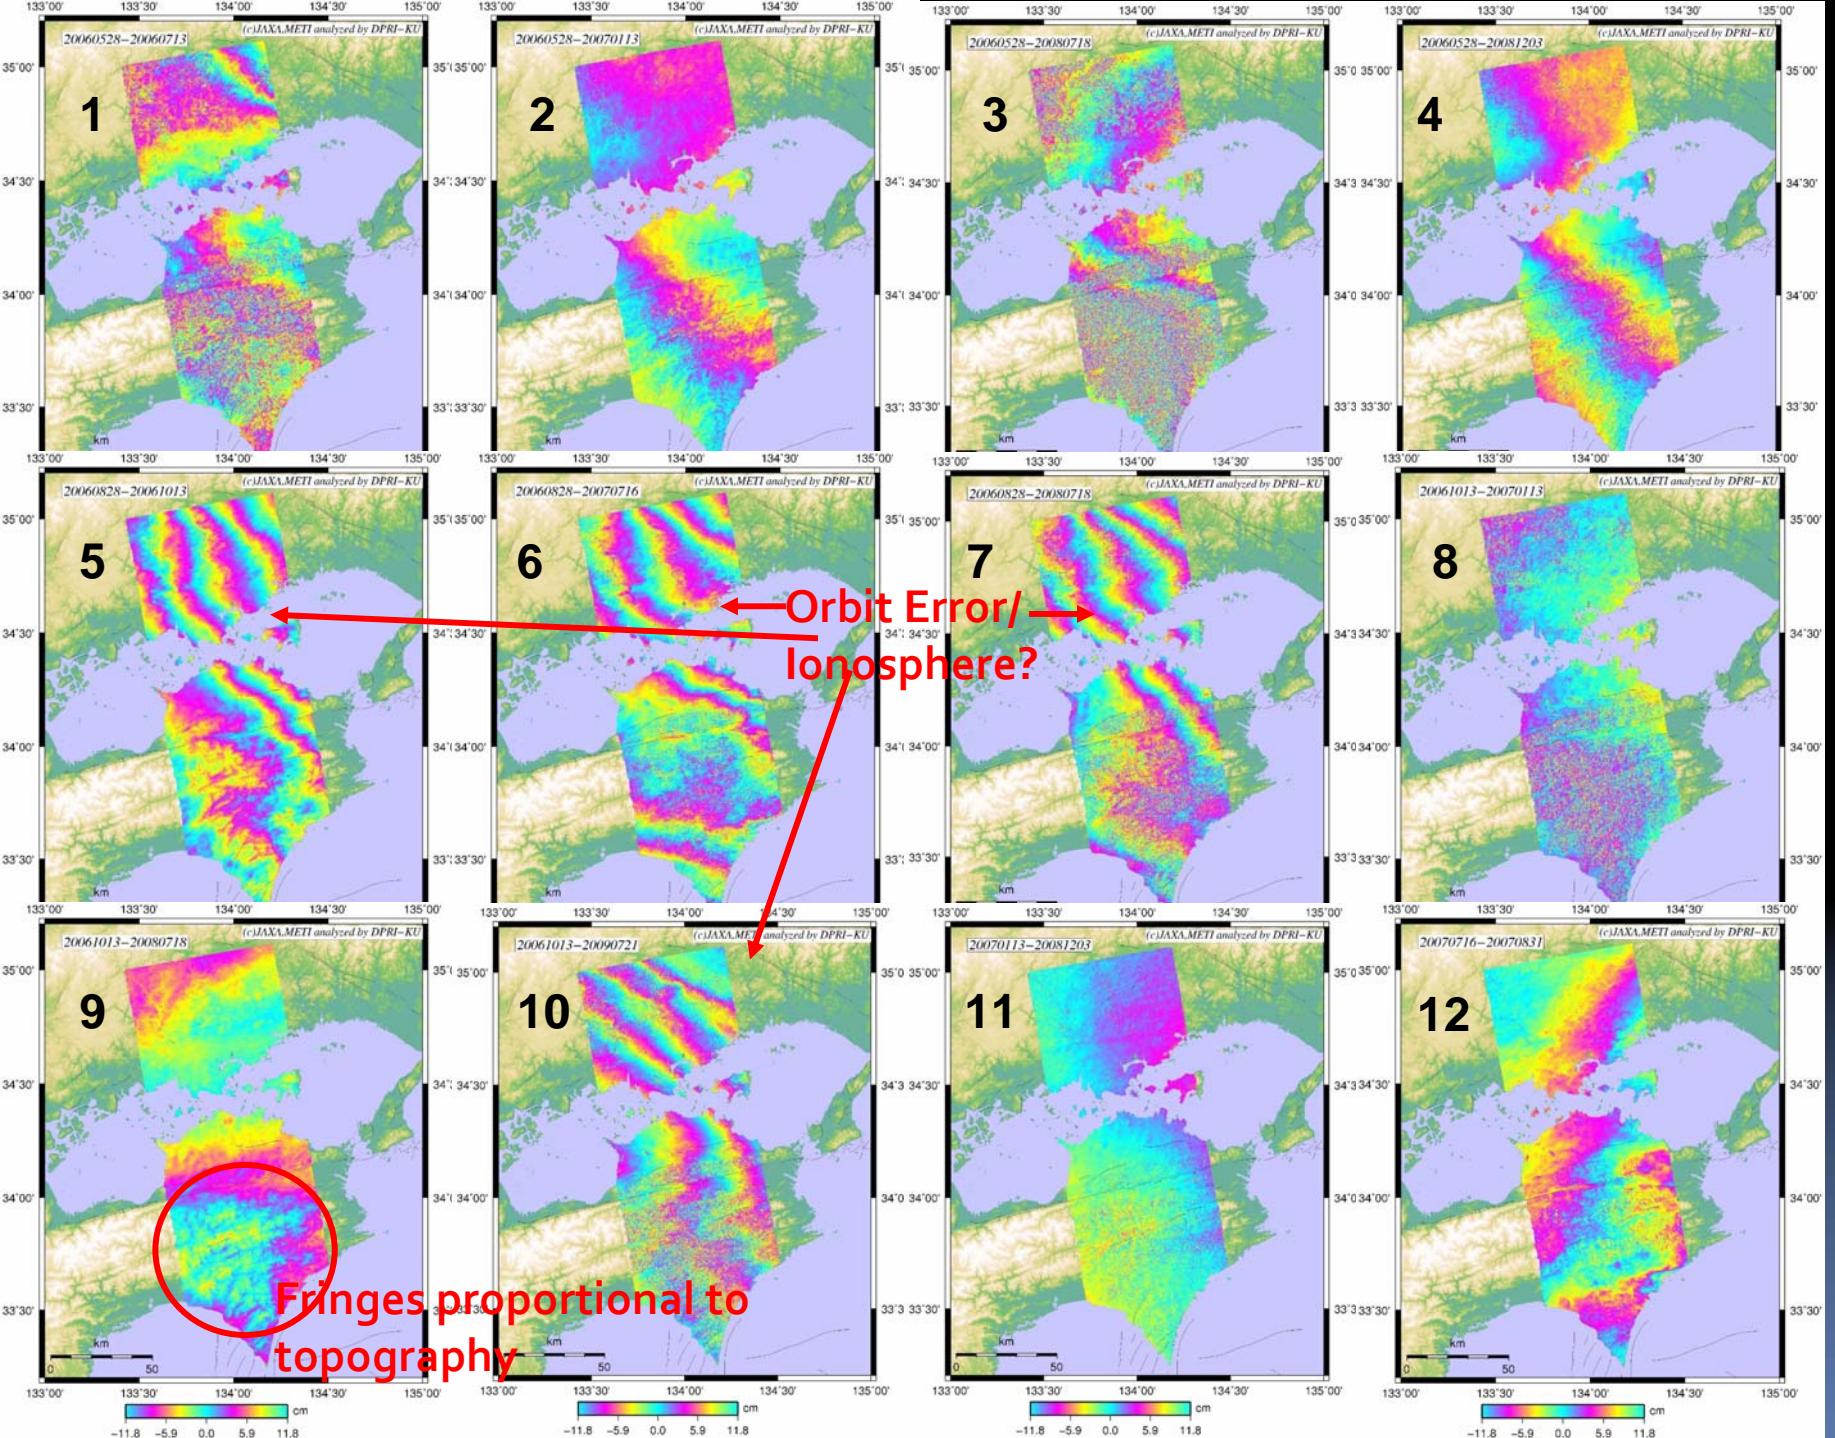

Shikoku Area (Path 417)

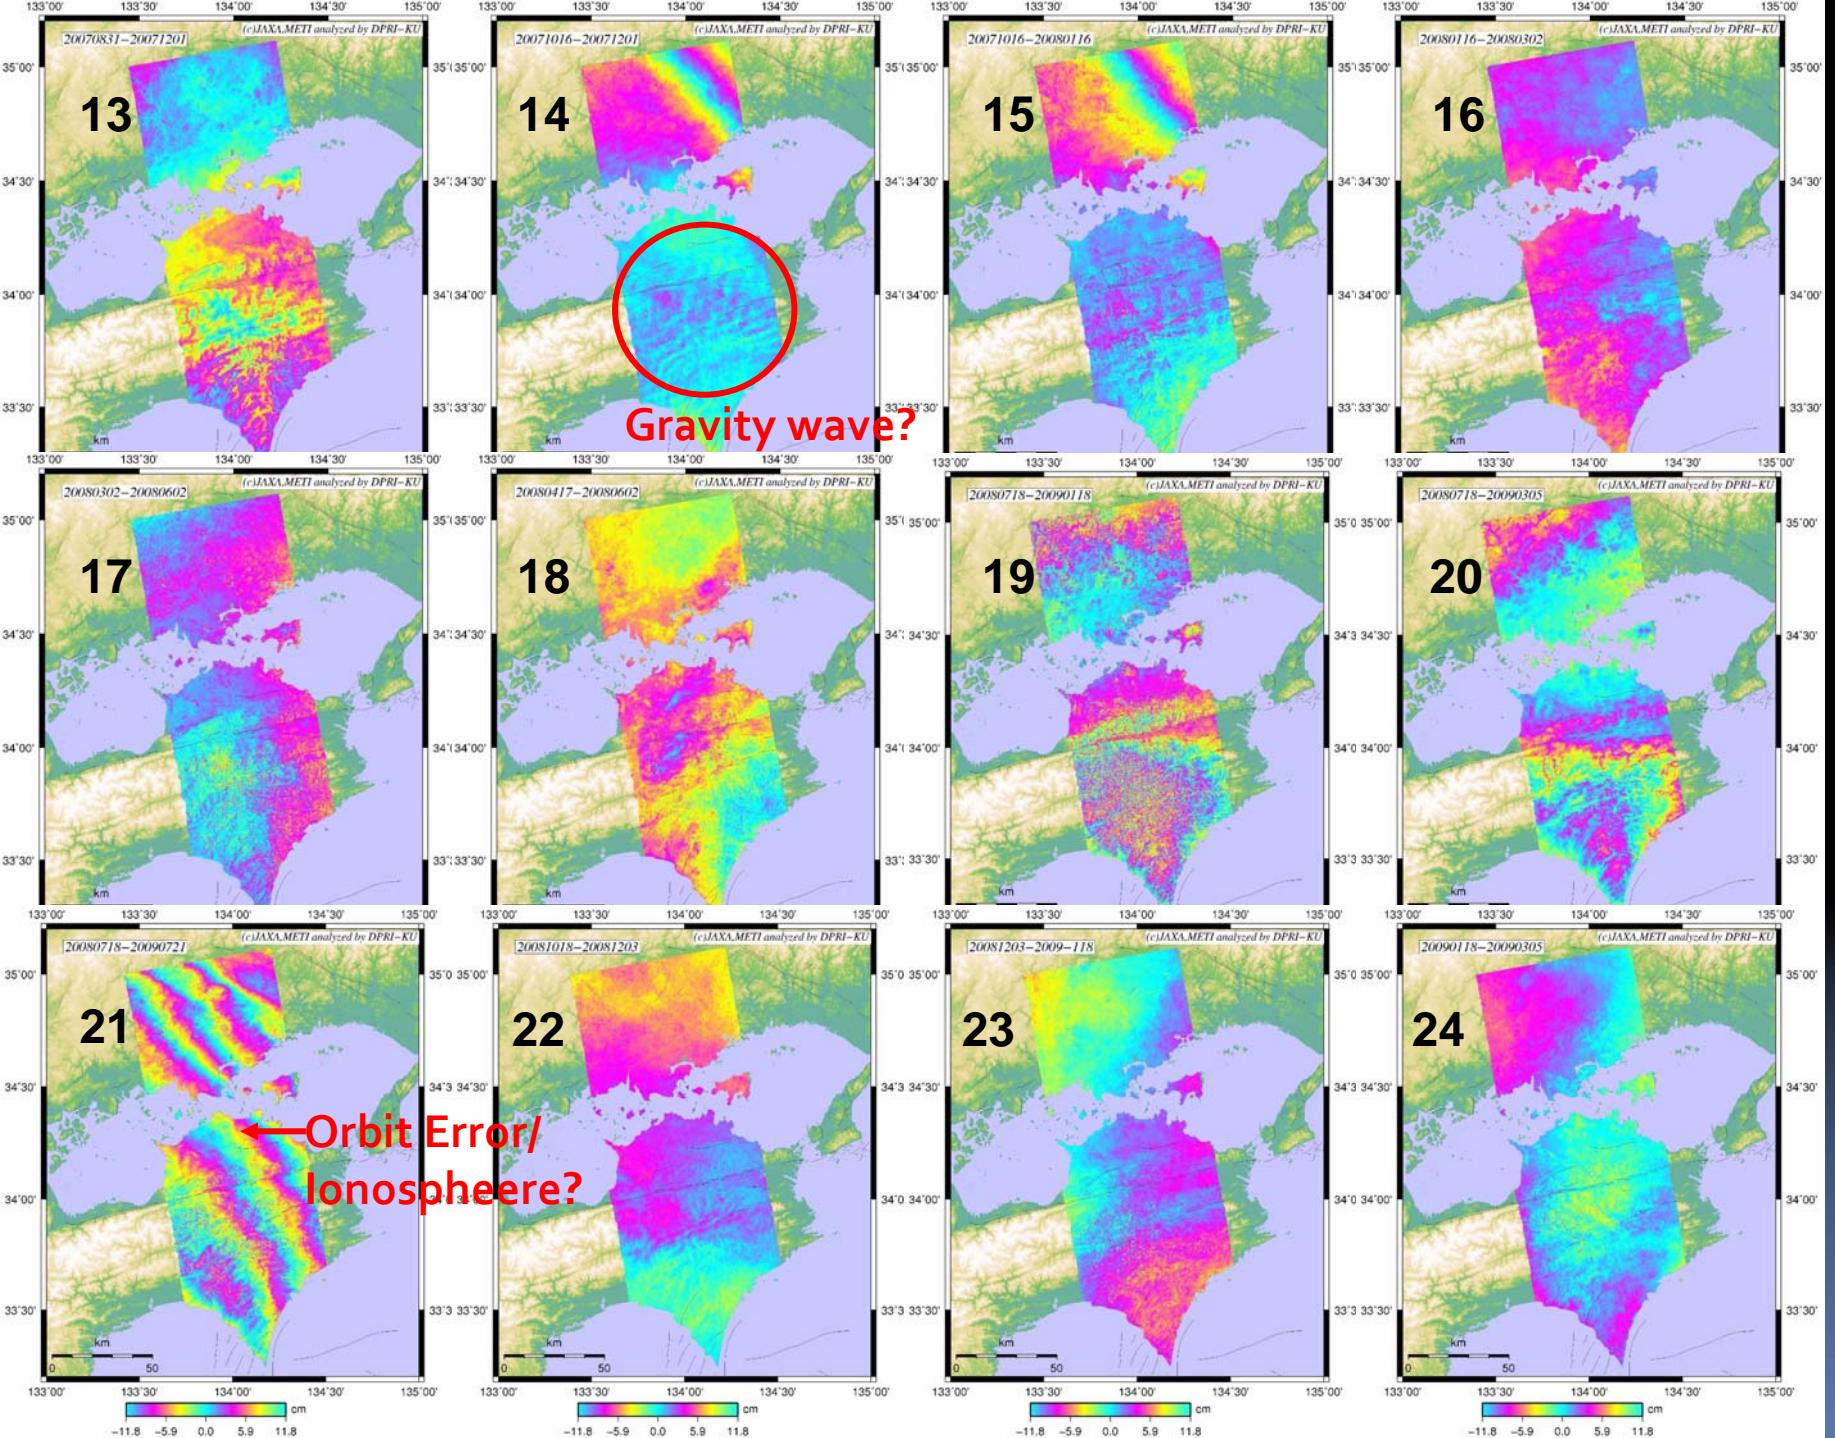

- 19 acquisitions during 2006~2008
- Pt. Muroto ~ Okayama

Shikoku: Bperp

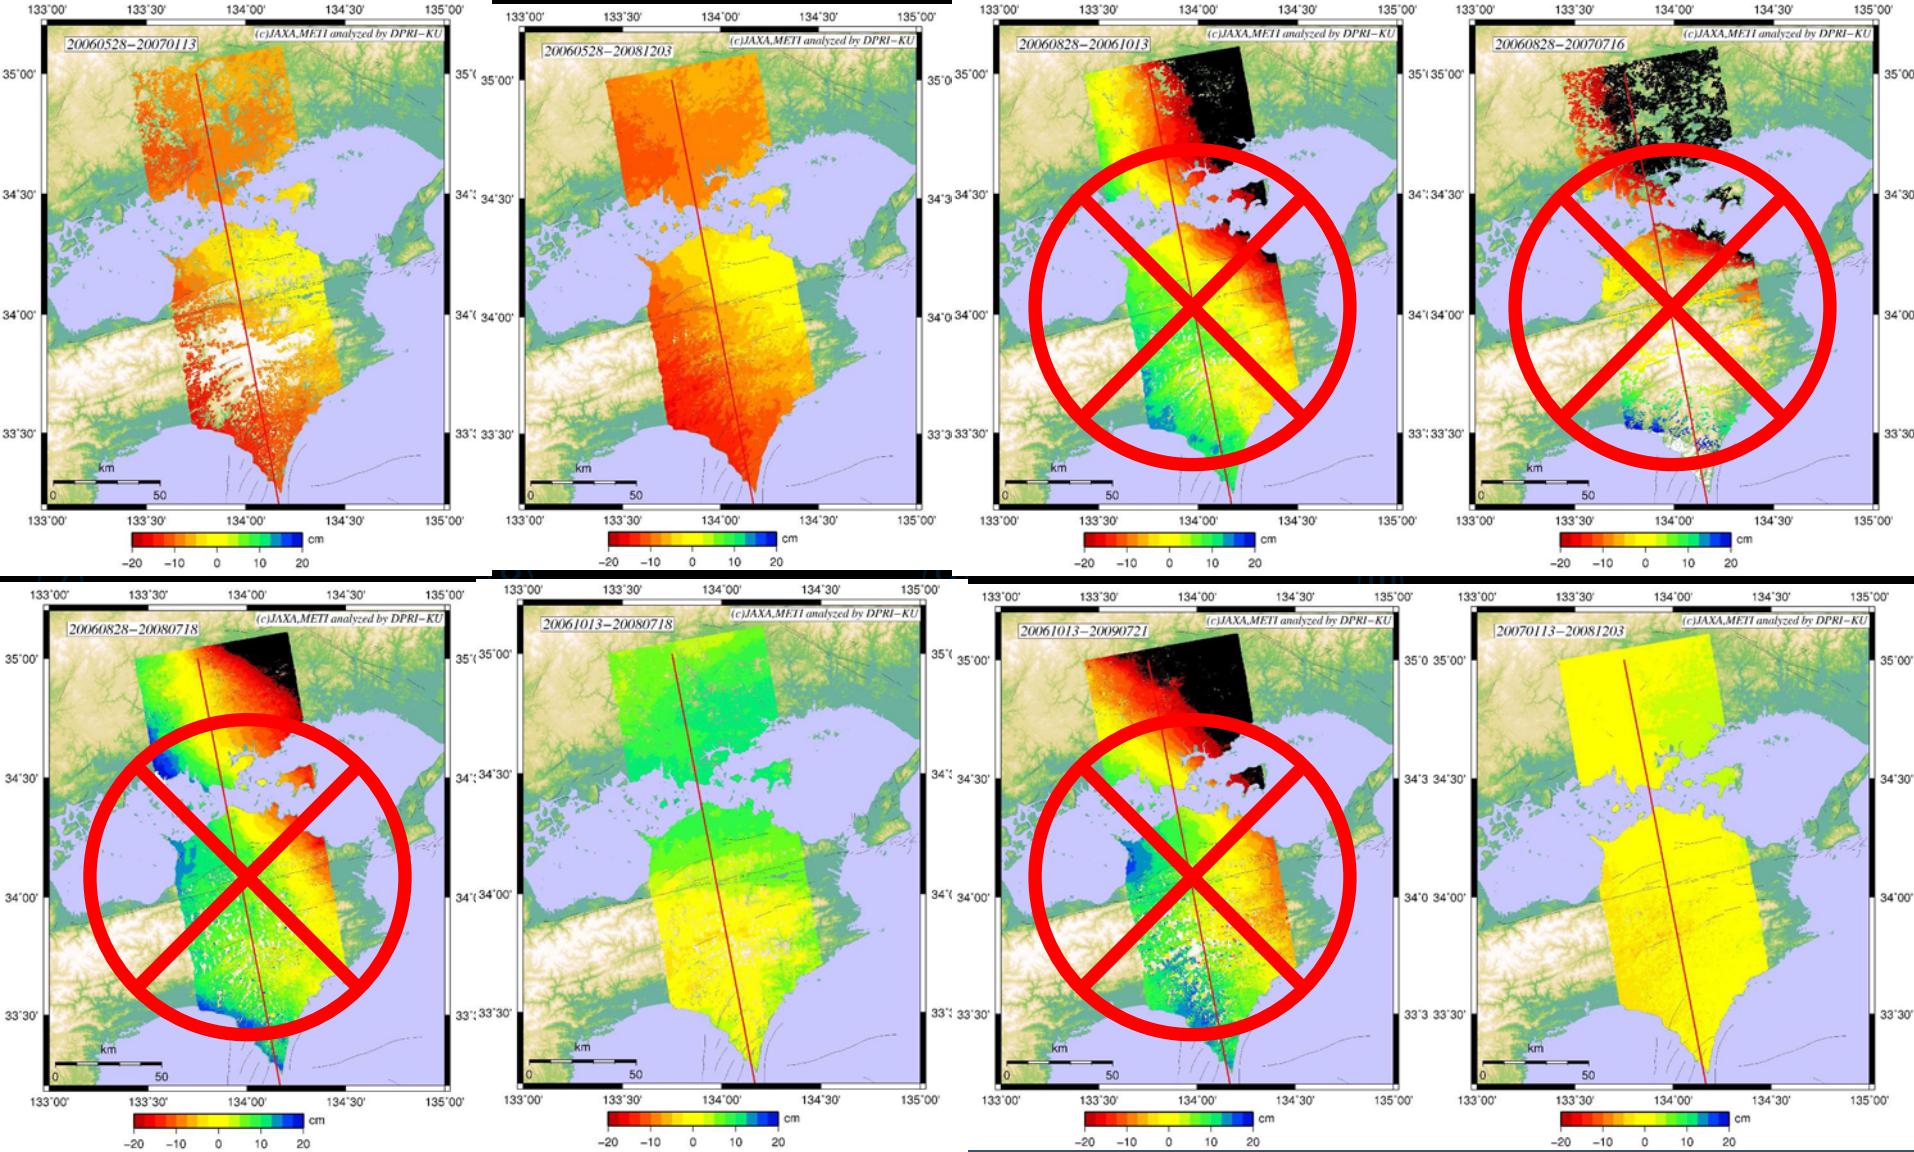

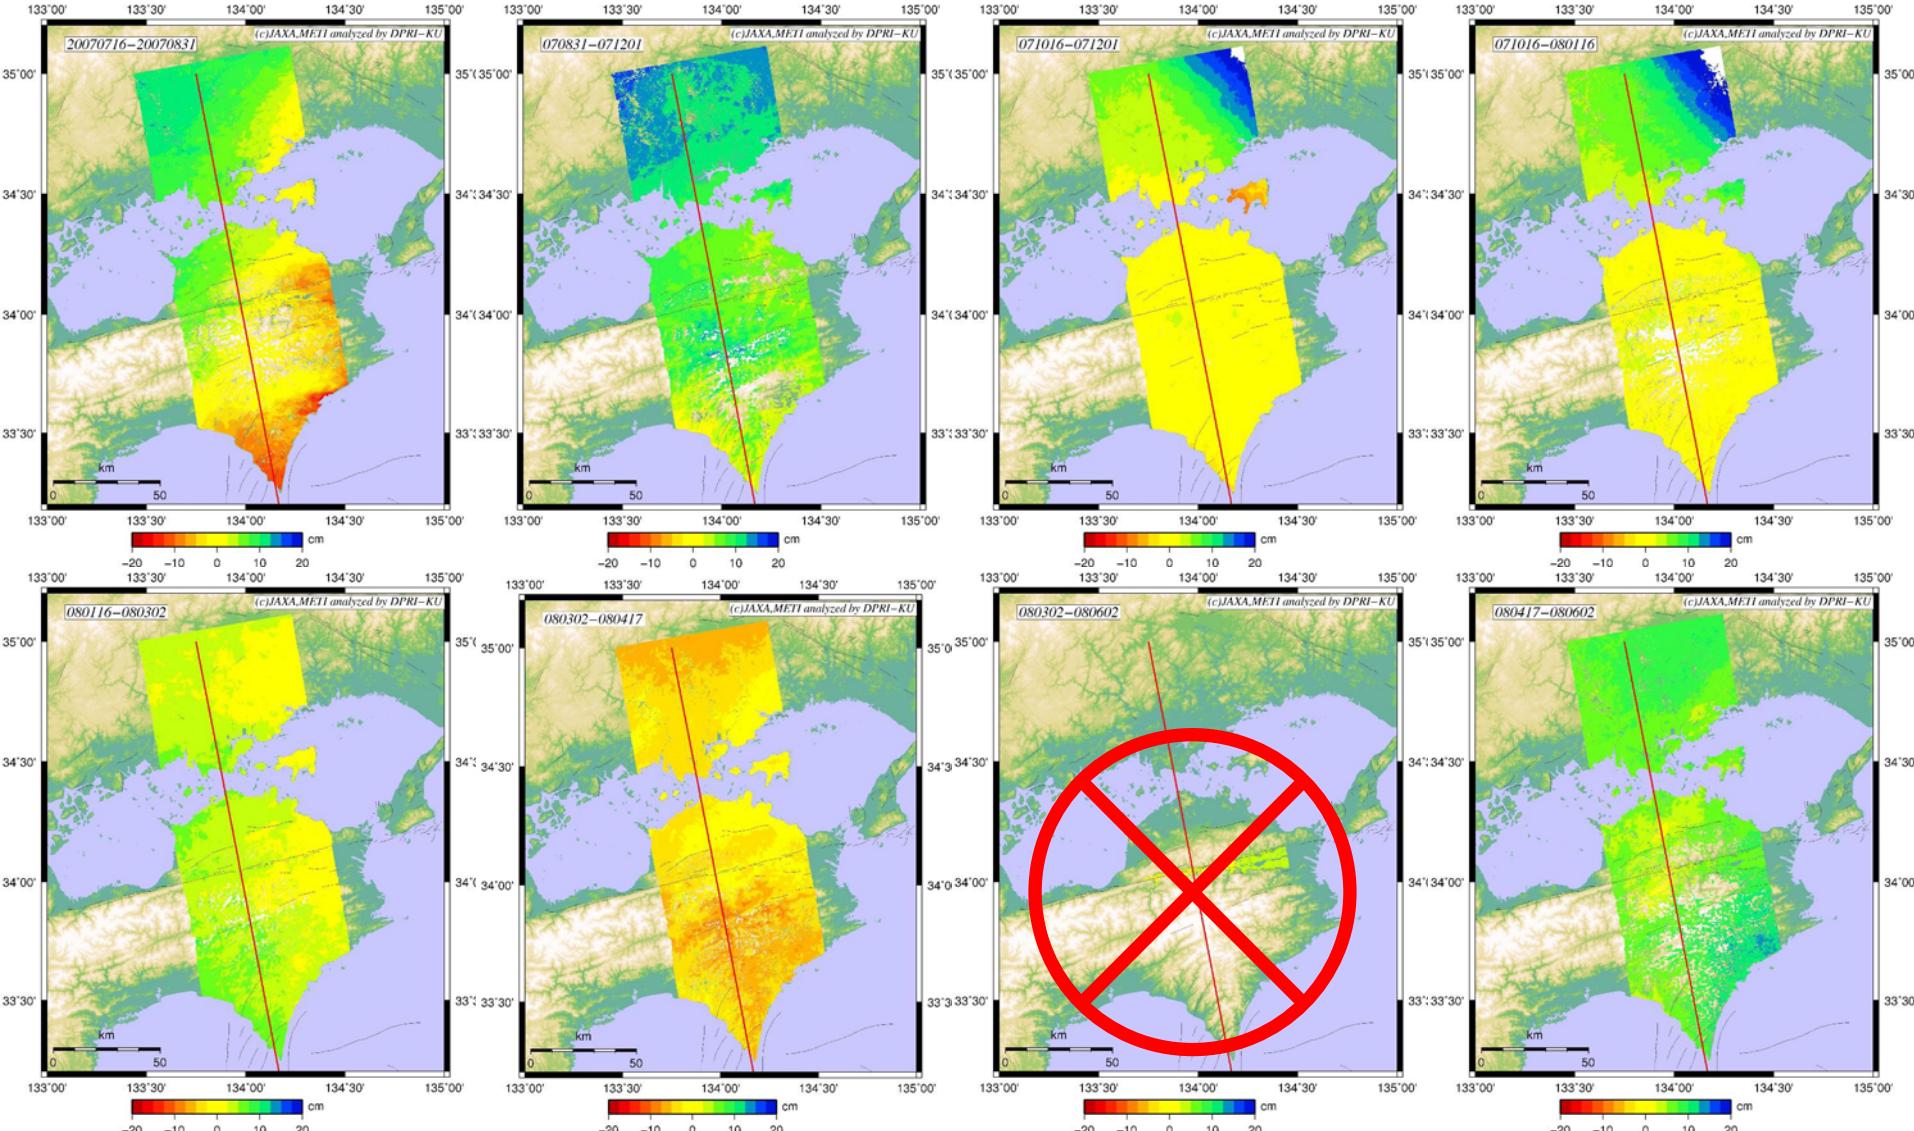

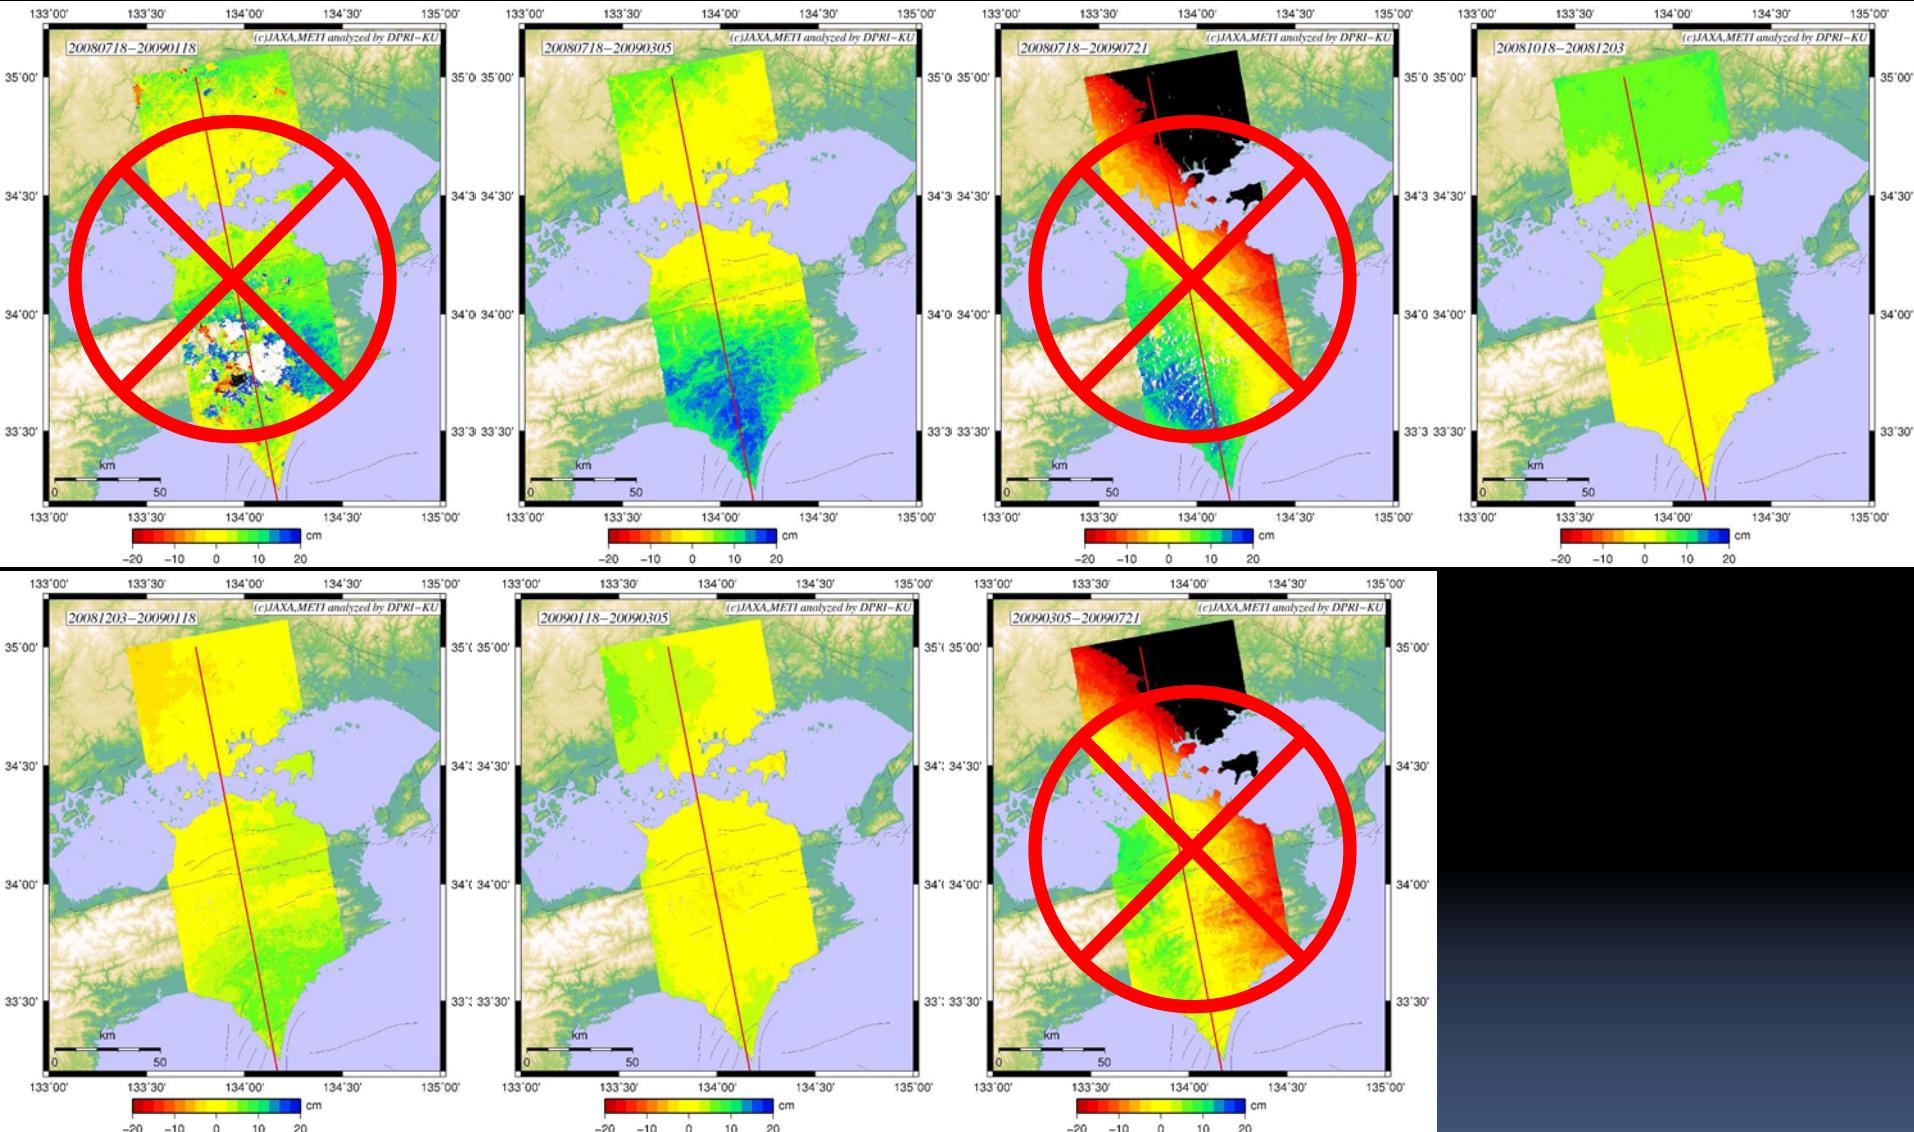

Unwrapped Interferograms

- Branch-cut
- Deformation profile using grdtrack in GMT

Processed with Branch-cut
Red line indicates the
sampling line .

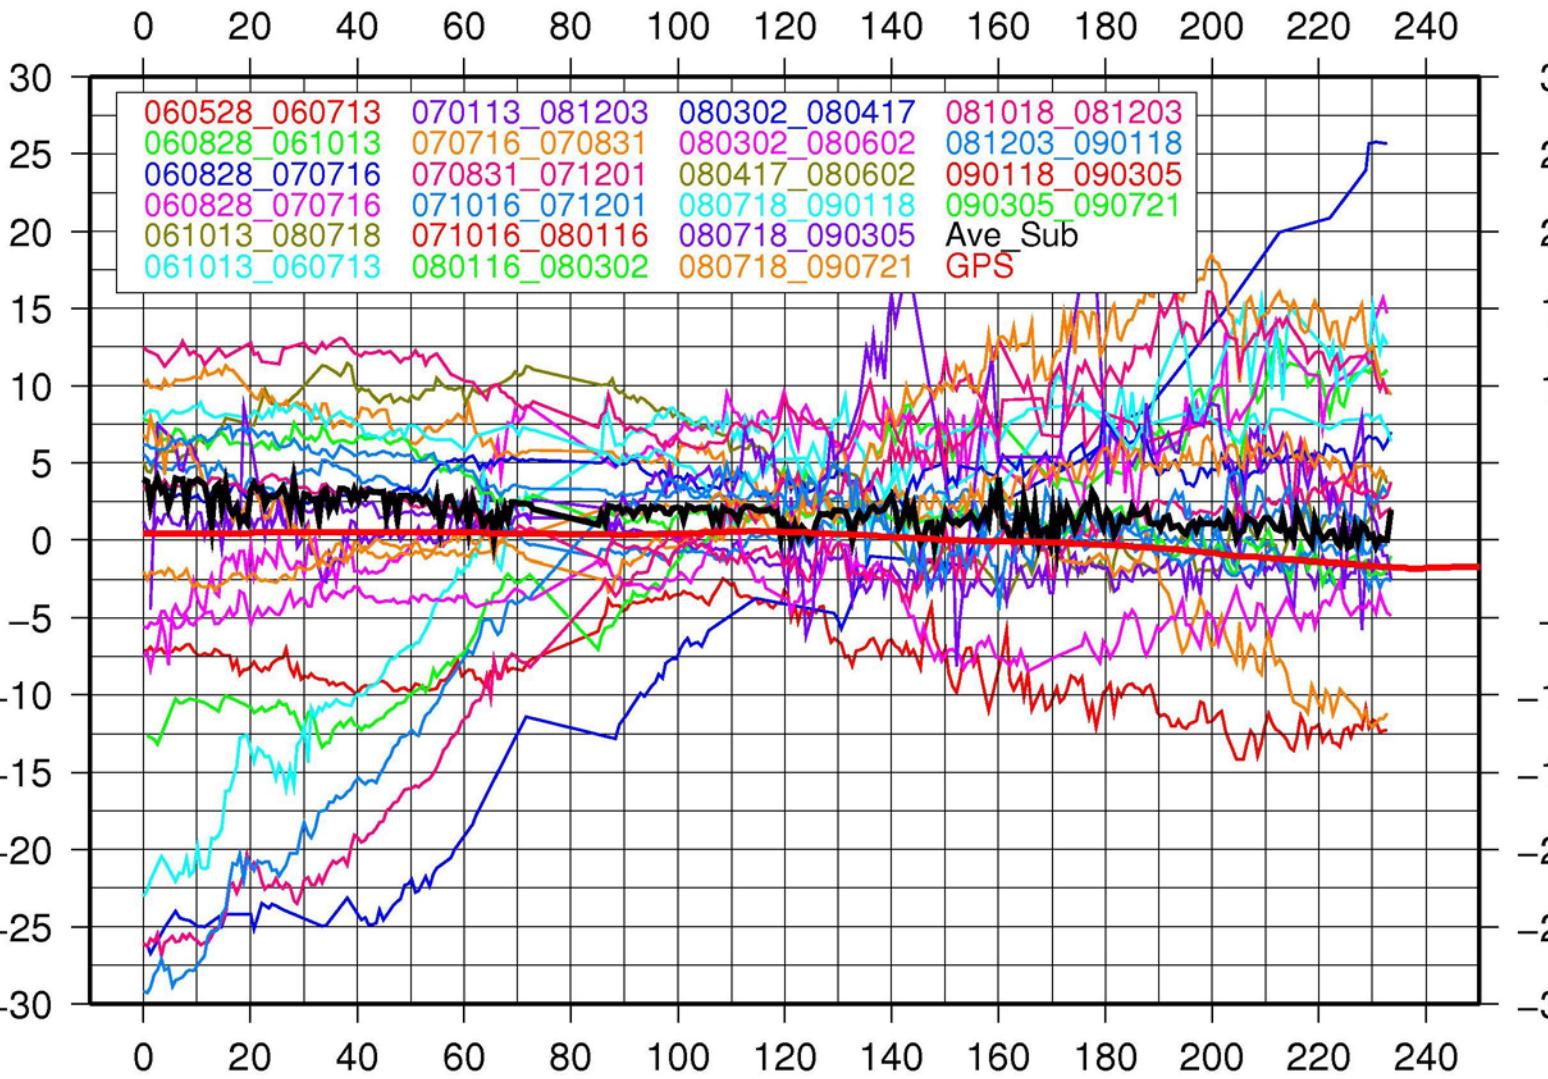

Distance along Profile in km

■ ■ ■

LOS Displacement in cm

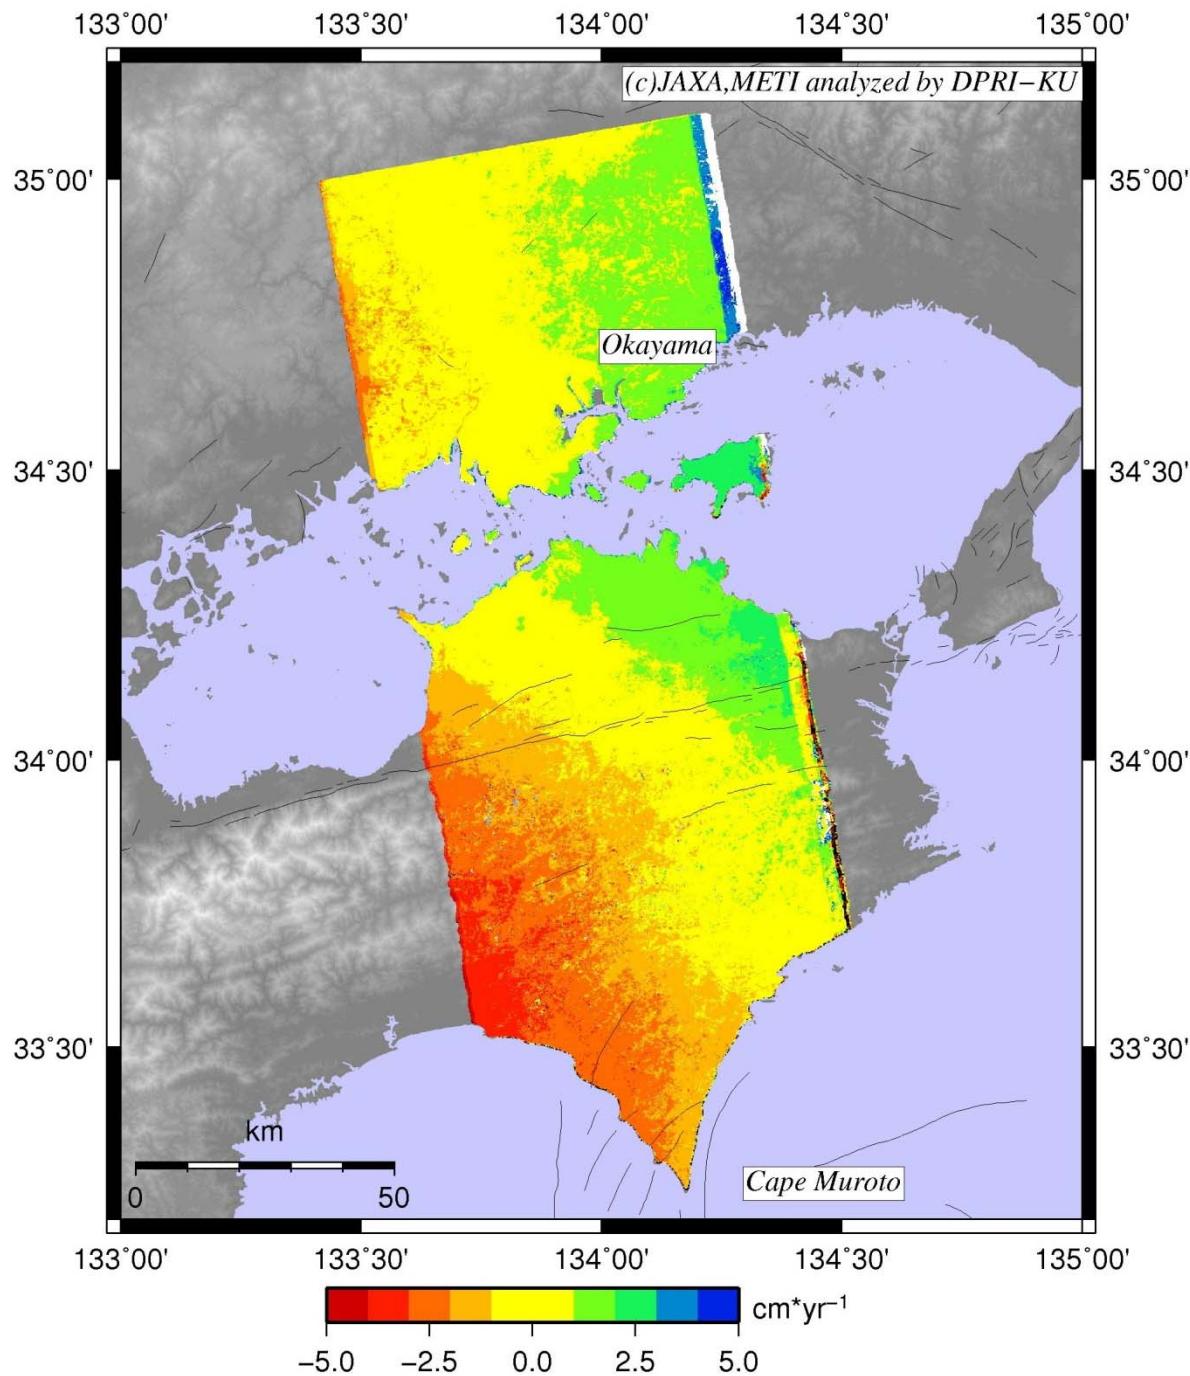

Distance along Profile in km

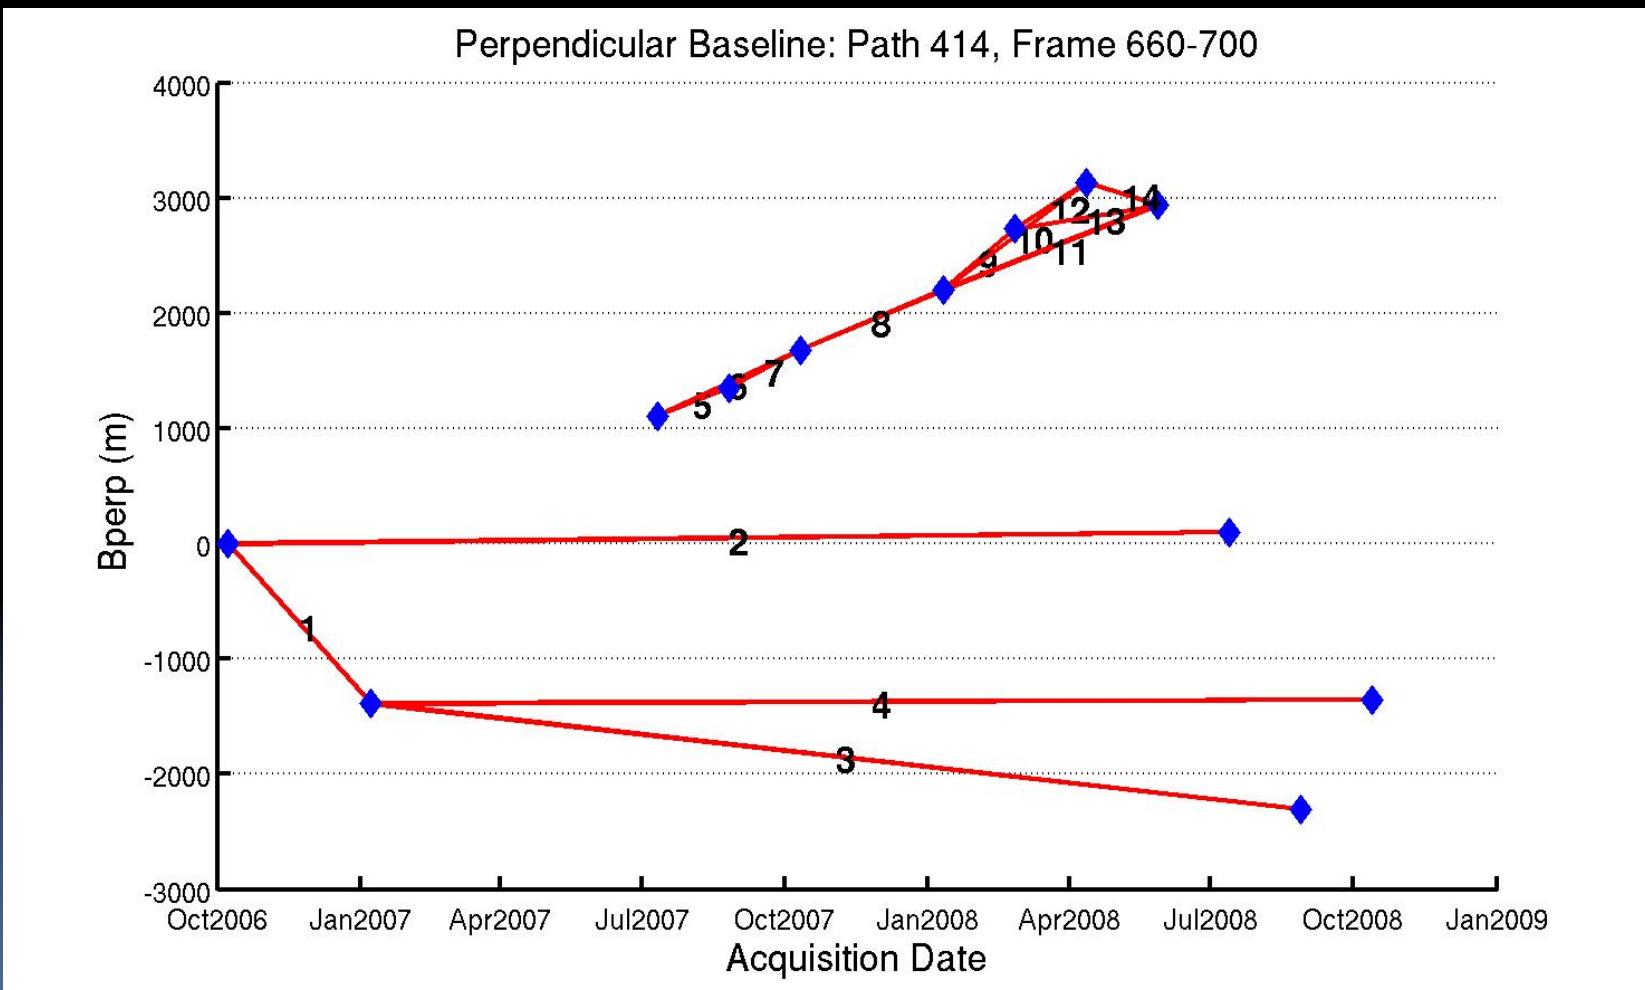

LOS Displacement in cm

Stacked Interferograms

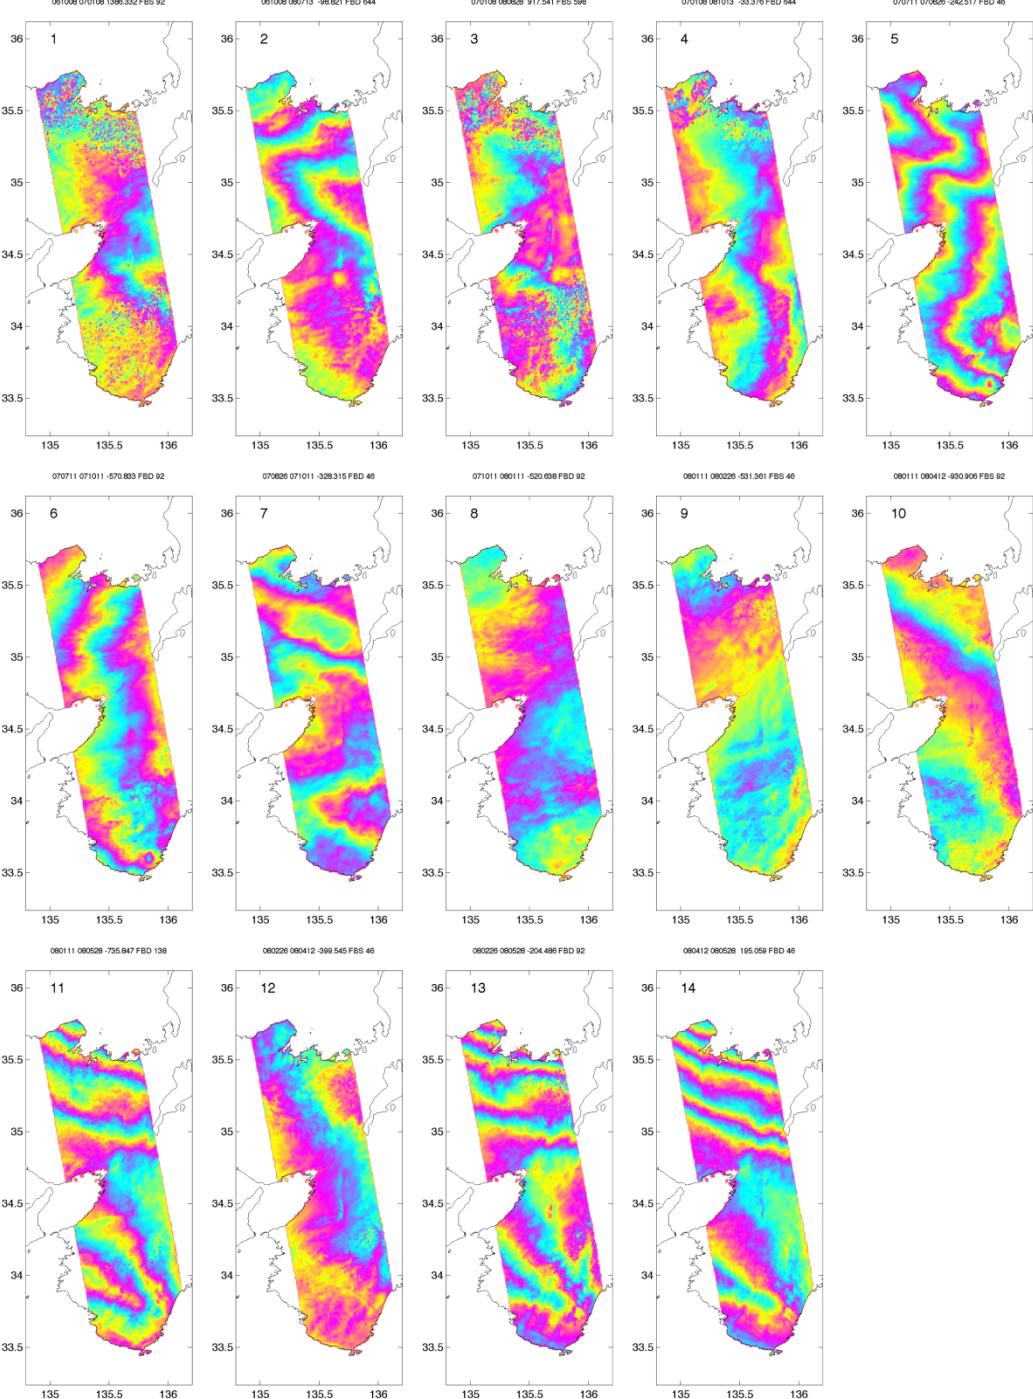

- With Stacking in Gamma
- Stacking of 15 interferograms
- More than 5 obs. at each pixel
- Larger than GPS

SAR Acquisition: Path 414

Interferograms along path 414

Summary

- $B_{\text{perp}} < 500\text{m}$ is necessary
 - $<300\text{m}$ is good for mountains
 - $>300\text{m}$ causes unwrapping problems
 - Fraction of residue $< 1\%$ for smooth unwrapping
 - $>500\text{m}$ is no use in mountains
- Disturbances in interferograms with small B_{perp}
 - Bad orbits or large ionospheric effect on 2006/08/28 and 2009/07/21 acquisition
- Short spatial baseline with long temporal baseline
- Spatial pattern of stacked interferogram
 - Fair(?) agreement with GPS
 - A bit larger than GPS

Can Time Series Analyses Be Applied to ALOS/PALSAR Data?

- So far it is not easy!
- Problems
 - Accuracy of orbit
 - Fringes due to orbit error
 - Difficulty in unwrapping
 - Irregular Recurrence
 - Accumulation of interferograms with long B_{temp}
 - Tropospheric/ionospheric disturbances
 - Fringe proportional to topography
 - Irregular fringes
